  - ***resource provisioning*** through multi-level scheduling techniques
  - ***data diffusion*** and data-aware scheduling to leverage the co-located computational and storage resources

Falkon Overview

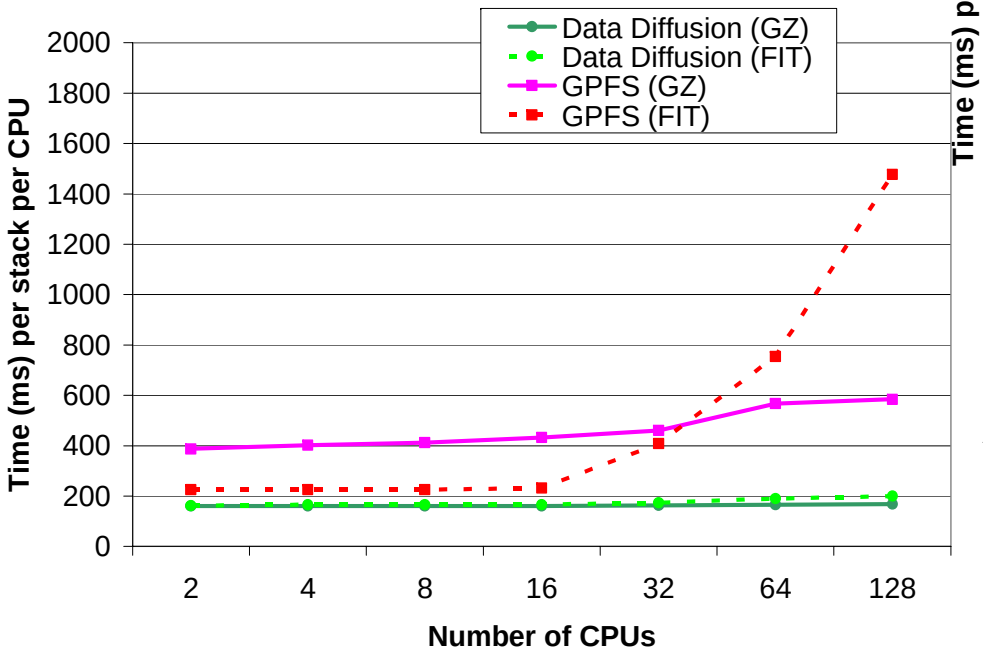
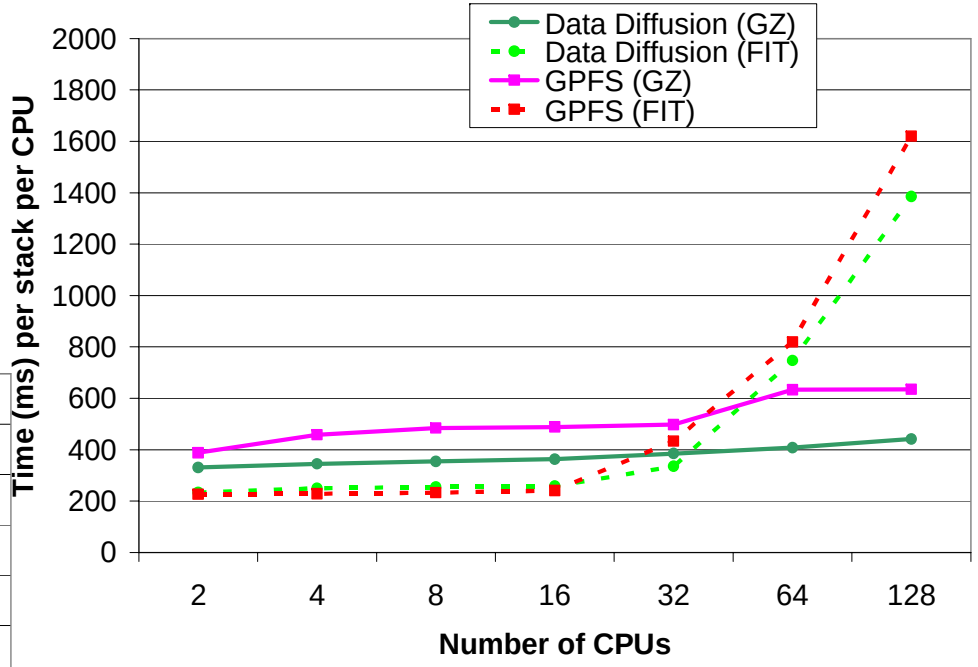
AstroPortal Stacking Service with Data Diffusion

Low data locality ➔
- Similar (but better) performance to GPFS

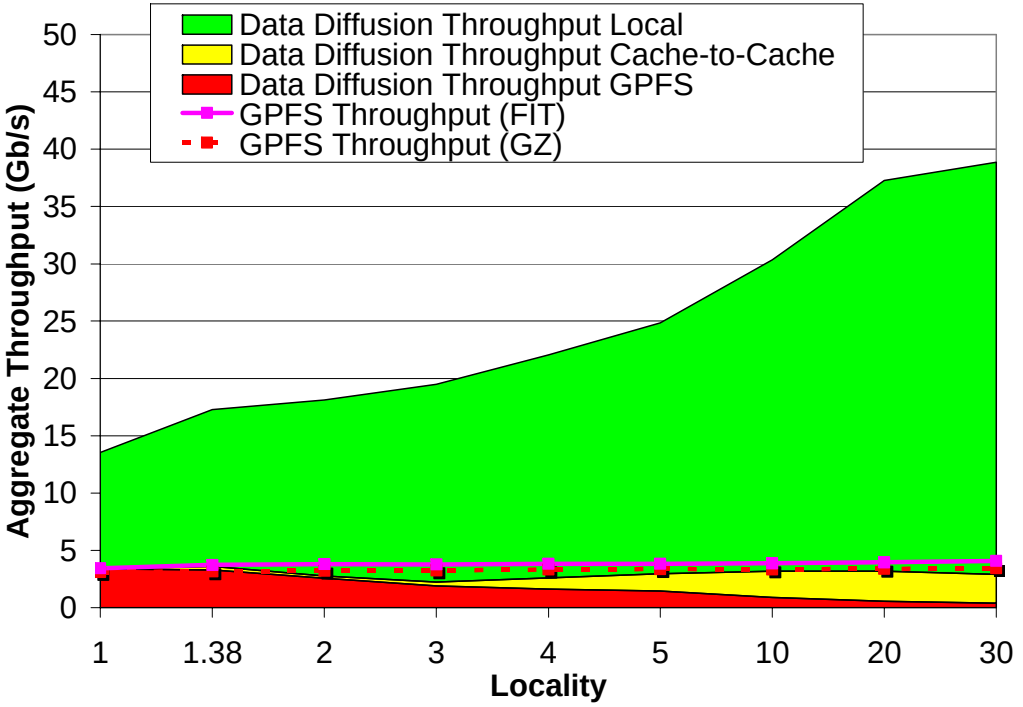


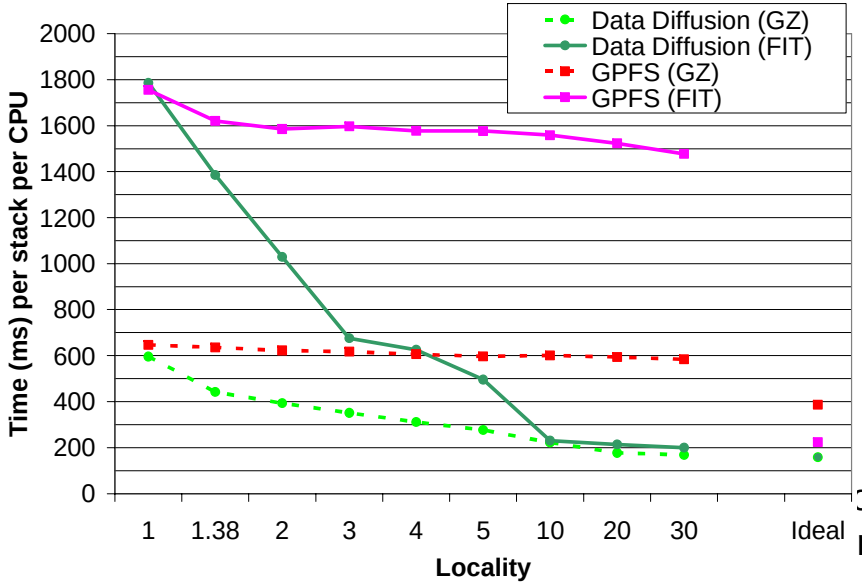


➔High data locality
- Near perfect scalability

AstroPortal Stacking Service with Data Diffusion

- Aggregate throughput:
  - 39Gb/s
  - 10X higher than GPFS
- Reduced load on GPFS
  - 0.49Gb/s
  - 1/10 of the original load

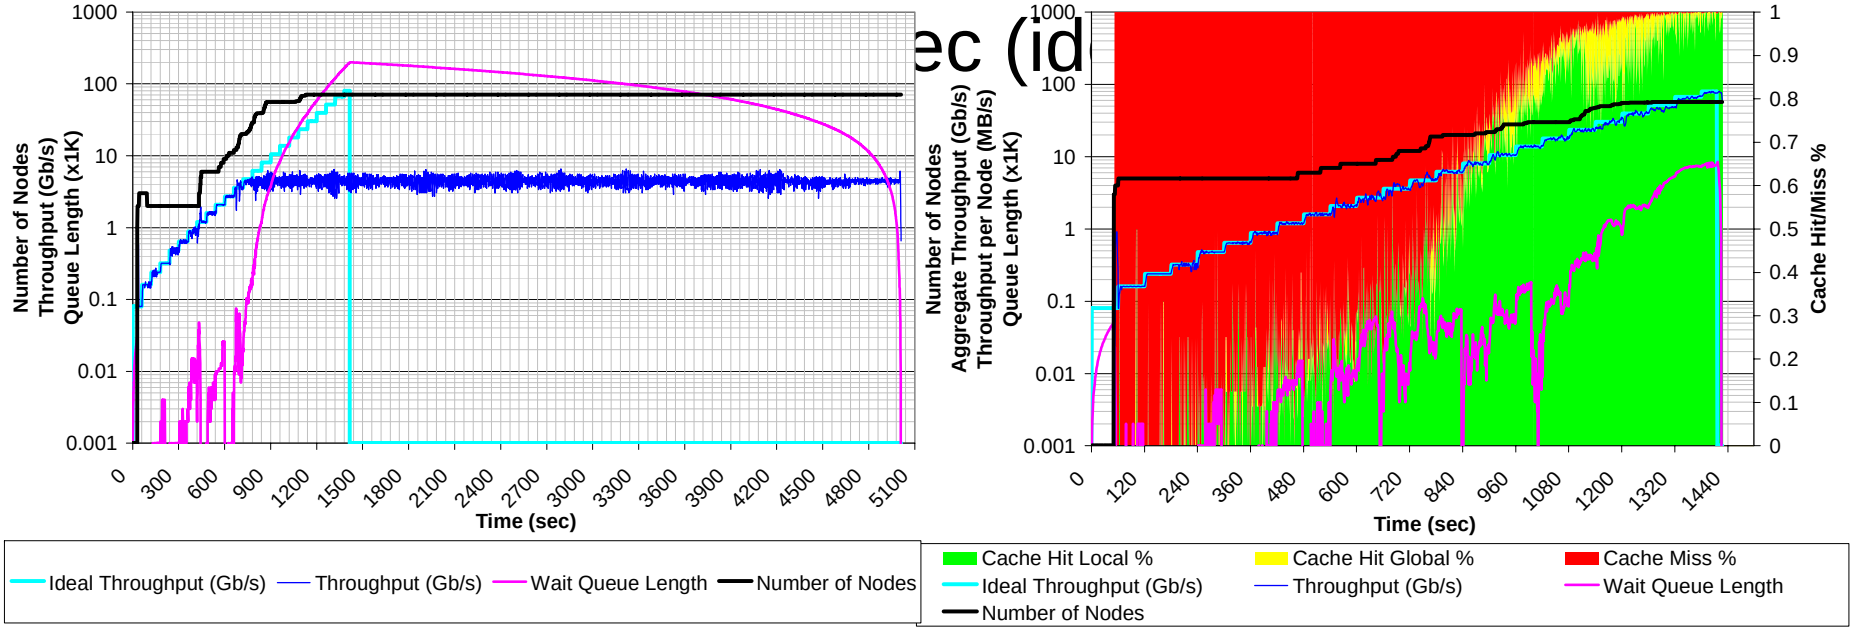




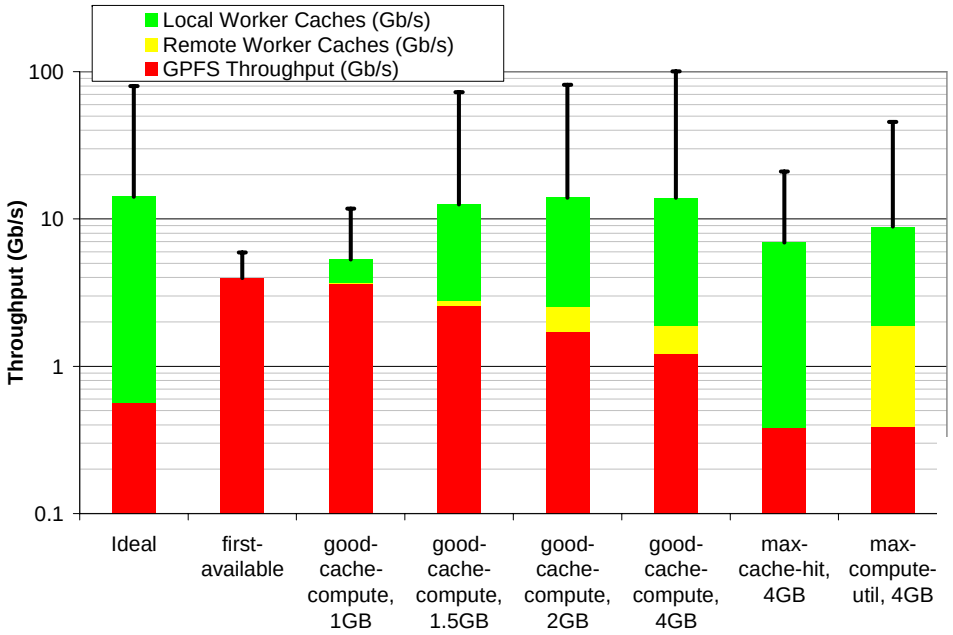
- Big performance gains as locality increases

Data Diffusion: Data-Intensive Workload

- 250K tasks on 128 processors
  - 10MB read, 10ms compute
- Comparing GPFS with data diffusion



Data Diffusion: Data-Intensive Workload

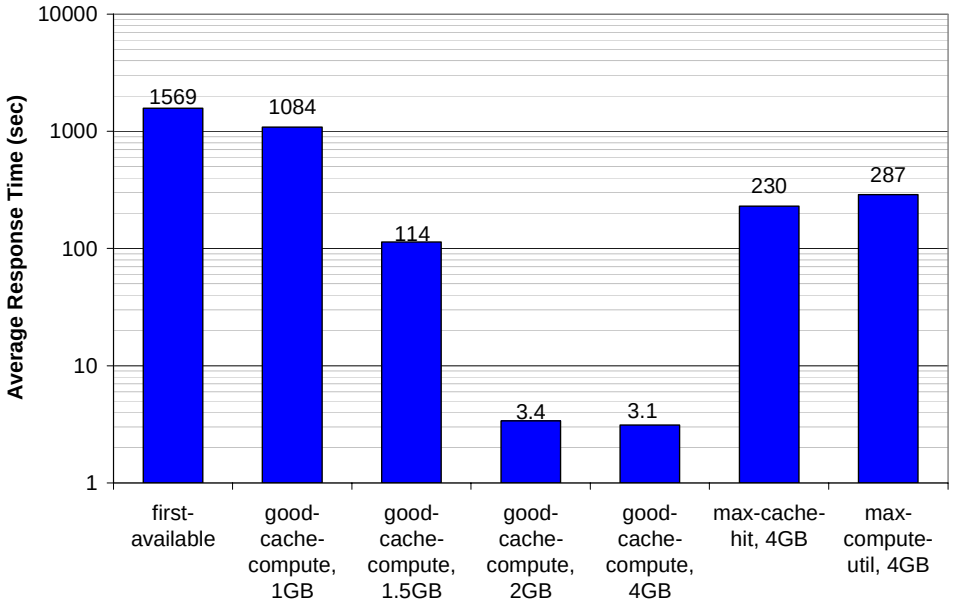


← Throughput:

- Average: 14Gb/s vs 4Gb/s
- Peak: 100Gb/s vs. 6Gb/s

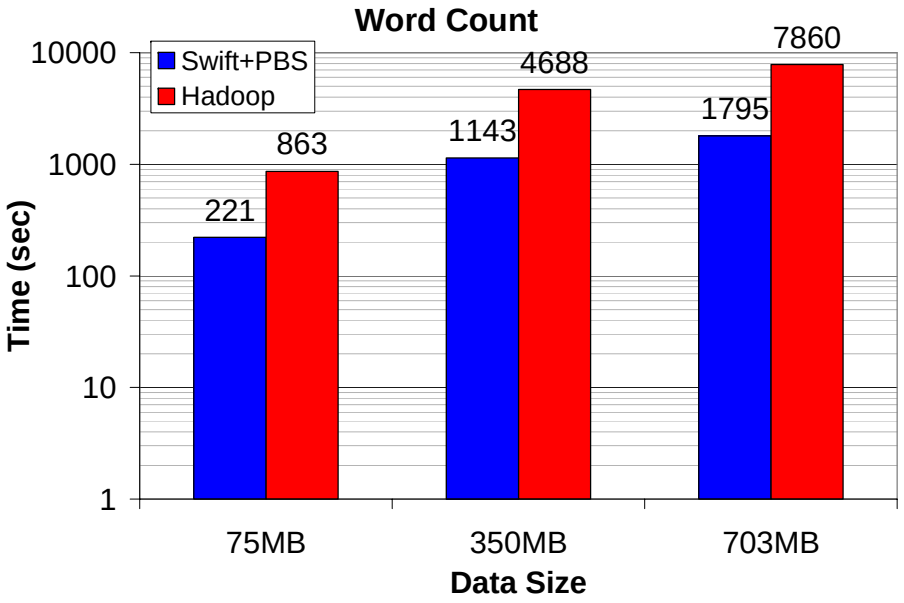
Response Time →

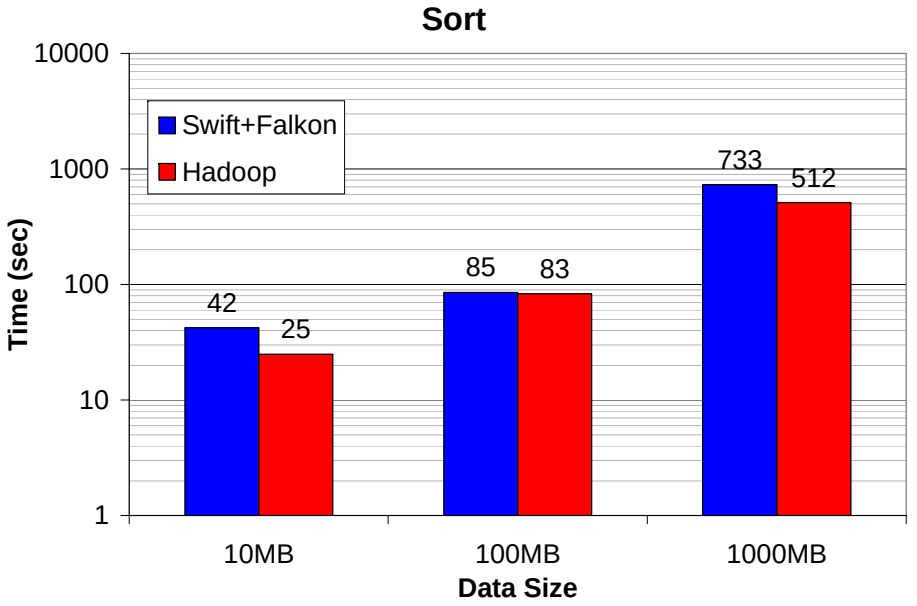
- 3 sec vs 1569 sec → 506X



Hadoop vs. Swift

- Classic benchmarks for MapReduce
  - Word Count
  - Sort
- Swift performs similar or better than Hadoop (on 32 processors)





Mythbusting

- ~~Embarrassingly~~ Happily parallel apps are trivial to run
  - Logistical problems can be tremendous
- Loosely coupled apps do not require "supercomputers"
  - Total computational requirements can be enormous
  - Individual tasks may be tightly coupled
  - Workloads frequently involve large amounts of I/O
- Loosely coupled apps do not require specialized system software
- Shared file systems are good all around solutions
  - They don't scale proportionally with the compute resources
